Leuven and Gembloix, Belgium. 5-8 June 2011

Background

HTLV-1 infection alters the immune function and increases the risk of several infectious diseases. In this meta-analysis, we assess the association between HTLV-1/2 and active tuberculosis (TB).

Published: 6 June 2011

Methods

Four databases were searched for relevant articles that describe the frequency of HTLV-1/2 infection among TB patients and control groups of healthy individuals or patients without a history of TB. Data were analyzed using the EasyMA software.

Cite this article as: Arruda et al.: Association between Human T-Cell Lymphotropic Virus Type 1 and 2 (HTLV 1/2) infection and tuberculosis: systematic review and meta-analysis. *Retrovirology* 2011 **8**(Suppl 1):A80.

Results

The search yielded two hundred and eight articles. Six met the inclusion criteria and were included in the meta-analysis. The estimated relative risk of HTLV-1/2 infection in TB patients was 3.25 times higher than in the population based control groups.

Conclusion

Patients with active TB have a higher risk of HTLV-1/2 infection. Prospective studies involving latent tuberculosis infection (LTBI) in HTLV-1-infected individuals are necessary to evaluate the potential benefit of TB chemoprophylaxis.
